TITLE: Synthesis of the schemes realizing combinatorial operators

CITED SOURCE: Tr. Sibirsk. fiz.-tekhn. in-ta, vy*p. 42, 1963, 44-55

TOPIC TAGS: Gray code counter, shift register, Gray code counter synthesizing, combinatorial operator

TRANSLATION: Based on the Boolean algebra, a synthesis of a Gray-code counter with a digit blocking and a synthesis of a generator of combinations of n things, k at a time, are presented. These devices can be used in a control system of a specialized computer for investigating communication and control systems. Two methods are analyzed in synthesizing the Gray-code counter. In the first method, the conventional binary positional counter is used for obtaining Gray-code numbers (by a definite algorithm). Owing to the drawbacks of the first method (lower counting rate and need for additional equipment when symmetrical outputs in each counter digit are realized), the second method is used in the synthesizing in

Card 1/2

ACCESSION NR: AR4035562

which the Gray-code natural numbers appear directly in the counter. A Gray-code counter synthesis with blocking any k digits is presented. A functional scheme of odd and even cells is given. An algorithm underlying the generator of combinations of n things, k at a time, is described. This algorithm is also illustrated by a table presenting all combinations of 6, three at a time. An optimum scheme for realizing the algorithm consisting of k shift registers is presented. A scheme of 2-cycle magnetic-core shift register is analyzed. Six illustrations, two tables. Bibliography: 5 titles.

Measurement of Spectra and the Average Position Number in the
 Transition of ψ_{35} and ψ_{20} by 14.3-Mev Electrons

PHYSICAL,

Zhurnal eksperimental'noy i teoreticheskoy fiziki, 1960, Vol. 30, No. 3, pp. 671-684

Fig. 1

The present article deals in detail with the experimental investigations made in the energy range 0.4 - 5 Mev by means of the $\text{He-}^3\text{-}^4\text{He}$ isotopic and a pulsed neutron source. The experimental arrangement is schematically shown in Fig. 1. The reaction $\text{He-}^3\text{-}^4\text{He}$ served as primary neutron source in the target of an accelerator. The target was bombarded with 150-keV deuterons. The $\text{He-}^3\text{-}^4\text{He}$ determination was carried out electronically by measuring the time interval between the pulses in the detector. The detector response was obtained by modulations, i.e., by means of a sinusoidal

3 1/4

Chemical field ($\sim 20\text{ kV/cm}$) the pulses of the β -ray source neutron tested source and had a frequency of 4 Kc/sec. On the average, 4 neutrons were obtained per pulse. Two flashion chambers were used (with 15-55 (90 per cent) and 2-30 (natural isotope composition)), the chambers were filled with a mixture of argon and CO_2 gas (10 to per cent) at 760 torr. A total crystal (diameter 40 mm, thickness 25 mm) with a photomultiplier of the type PM-35 served as a neutron detector. The efficiency of the detector was determined according to Fig. 2. Fig. 2 shows the efficiency as a function of the energy of three activated neutrons 0.2, 0.25, and 0.3 mev. The electronic apparatus used to measure the pulse distribution in the detector with respect to time is described in detail. Fig. 3 illustrates a block scheme, Fig. 4 a recorded pulse spectrum, Fig. 5 shows the time distribution of the pulses recorded with the measurement of the neutron spectrum of the D_2O flashion. Besides neutrons and γ -rays of the flashion the following were also recorded: β -ray primary electrons, neutrinos, and μ -quanta due to interaction between primary neutrons and parts of the apparatus, radiations of the activated

Case 2/3

of ^{235}U and ^{238}U neutrons, and \bar{E} —average energy of the neutrons. The \bar{E} measured values from the background are discussed. The neutron spectrum of ^{235}U and ^{238}U fission are shown in Figs. 7a and 7b. All curves show a similar character: a steep ascent, a peak, and an even descent. Figs. 6a and 6b show the diagrams made for the analysis of the spectra in the coordinates $\ln(E/E_0)$ and E_0 . The spectrum may be satisfactorily represented by $\exp(-E/E_0) \exp(-E_0^2/\bar{E})$ at $\frac{2\sqrt{E_0}}{\bar{E}}$. The following numerical values

The analytical results are listed in Table 1. The following parameter values are indicated: for U^{235} , $T = (1.06 \pm 0.03) \text{ MeV}$; $T = (0.37 \pm 0.04) \text{ MeV}$ for

α (fraction of evaporated neutrons) = $(0.16 \pm 0.02)\%$ for v
 $\alpha = (1.16 \pm 0.05)$ Mev $\pm (0.40 \pm 0.04)$ Mev; $\alpha = (0.21 \pm 0.02)\%$. The average
number of neutrons emitted in the fission $\bar{\nu}$ is 4.17 ± 0.30 (v^{235}) and

Case 3/4

4.75 ± 0.30 (v^{238}), the ratio $\bar{v}(v^{238})/\bar{v}(v^{235}) = 1.03 \pm 0.03$. The following data were obtained: v^{235} , $d\bar{v}/dE_n = 0.112 \pm 0.011$ and v^{238} , $d\bar{v}/dE_n =$

$= 0.115 \pm 0.011$ (E_n - neutron energy). In conclusion, the authors thank

TITLE: Measurement of the Neutron Spectrum in the Area below 0,5 MeV by
Means of the Time of Flight Method (Izmereniye spektrov neytronov
v oblasti energii nizhe 0,5 MeV metodom vremeni proleta)

PERIODICAL: Atomnaya Energiya, 1957, Vol. 3 , Nr 12, pp. 542-544 (USSR)

ABSTRACT: By applying an impulse source of neutrons the secondary neutron
spectrum is measured, which develops, if 14 MeV neutrons pass
through layers of uranium. A fission chamber, which was connect-
ed with a 30 channel analyzer, was used as a neutron detector. The
distance between source and detector was 6 m.
The energy spectra for the following samples were shown by a
graph:
a) U235 : 2,7 cm thick ($\sim 1/3 \lambda$ in)
b) U238 : 2,5 cm thick ($\sim 1/3 \lambda$ in)
c) U238 : 8 cm thick ($\sim \lambda$ in)
The spectra obtained from a) and b) originate from a simple
interaction between 14 MeV neutrons and the uranium nuclei: It
can be assumed that in the measured area of energy the develop-
ment of the secondary neutrons originate from evaporation from

Card 1/2

Measurement of the Neutron Spectrum in the Area 0,5 MeV by Means of the Time of Flight Method. 89-12-9/29

the stimulated conditions of the compound core.
For the case c) the development of a higher number of slow neutrons was ascertained. These are the consequence of a multiple-inelastic interaction which confirms the existence of low situated levels in the U^{238} nucleus. There are 3 figures and 3 references, 2 of which are Slavic.

TITLE: The structural transformations of synthetic cordierite 15

SOURCE: AN SSSR. Izvestiya. Neorganicheskiye materialy, v. 2, no. 2, 1966, 357-362

TOPIC TAGS: cordierite, crystal structure, silicate

ABSTRACT: The test samples were of cordierite synthesized from glass in a heat treatment of from 0.5 to 120 hours, at temperatures from 1100 to 1460°C. The heat treatment was done in a Silit furnace in platinum crucibles, with subsequent air cooling. Glasses of three composition were investigated: a stoichiometric cordierite composition, a composition with 10 weight % more silicon dioxide, and a composition with 10 weight % less silicon dioxide. X-ray investigations were carried out on a URS-50I unit. Results are shown in graphic and tabular form. As the result of prolonged heat treatment at 1400°C a lower rhombic form was obtained from the higher hexagonal cordierite. On raising the temperature up to 1460°C, the reverse transition was

Cord 1/2

UDC:548.19

L 24354-66

ACC NR: AP6007259

obtained with ordering of the structure of the cordierite. The process of transition from the high to the lower cordierite was observed electromicroscopically. It was established that the polymorphous transition with formation of rhombic cordierite is accompanied by partial amorphization of the crystal structure which proceeds at a high rate in a narrow temperature interval. The rhombic modification of cordierite is stable in the temperature range up to 1440°C. Orig. art. has: 4 figures and 2 tables. O

TITLE: Phase equilibria in the ytterbium oxide-alumina system and their comparison with equilibria in other $\text{Ln}_2\text{O}_3\text{-Al}_2\text{O}_3$ systems

SOURCE: AN SSSR. Izvestiya. Seriya khimicheskaya, no. 2, 1966, 212-217

TOPIC TAGS: phase diagram, phase equilibrium, alumina, aluminum oxide, aluminate, samarium compound, ytterbium compound, hardness, density, melting point, chemical resistant material, rare earth compound

ABSTRACT: Phase diagrams were constructed for the $\text{Yb}_2\text{O}_3\text{-Al}_2\text{O}_3$ and $\text{Sm}_2\text{O}_3\text{-Al}_2\text{O}_3$ systems. X-ray studies confirmed the compounds $2\text{Yb}_2\text{O}_3\cdot\text{Al}_2\text{O}_3$ and $3\text{Yb}_2\text{O}_3\cdot 5\text{Al}_2\text{O}_3$. The physical properties of the La, Er, Sm, Y, Tb and Yb aluminates were compared. The infusibility, hardness, density and chemical resistance of the rare earth aluminates helps make them suitable for high frequency ceramics, luminophores, materials for absorption of neutrons and protection against gamma radiation, and

| <p>Petrographic investigations of some ferrochrome slags and of fused magnesite. N. A. Timofeev <i>Izv. Inst. petrog. acid. res. U. R. S. S. R. Leningrad-Lening. Feitband 437-42(1934); Chem. Zentr. 1937, II, 1247-N.</i> - Chem. and mineralogical investigations of slags from basic and acid fusions in the elec. furnace indicated that slags from the ferrochrome process consisted chiefly of $MgO \cdot Al_2O_3$, minerals of the forsterite-monticellite group of the formula $Mg(Ca, Fe)SiO_3$, and glass; in the acid process more glass is present in the slag. Cr_2O_3 occurs in the form of a spinel or as a silicate. A spinel with 4.17% Cr_2O_3 shows a refraction of $n = 1.731 \pm 0.002$. The refraction is somewhat higher for monticellite from the basic process. Crystals of periclase and slight amts. of forsterite are present in the fused magnesite. The optical properties of fused and of causticized magnesite are similar. The suitability of slags from the production of ferrochrome for the manuf. of abrasives depends upon the spinel content.</p> <p>M. G. Minors</p> | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Chemical and mineralogical investigation of barium aluminate. N. A. Toropov. *Compt. rend. acad. sci. U. R. S. S. I.* No. 2-3, 147-149 (1935).
 Three compds. were found, all apparently with congruent m. pts.: $3\text{BaO} \cdot \text{Al}_2\text{O}_3$, tabular crystals, n (mean) = 1.735, double refraction weak, $d_m = 4.64 \pm .01$, hygroscopic and very sol. in water. $\text{BaO} \cdot \text{Al}_2\text{O}_3$, cubic crystals, $n = 1.693$, $d_m = 3.90 \pm .03$, m. p. = $1820 \pm 20^\circ$, readily sol. in water, not hygroscopic. $\text{BaO} \cdot 6\text{Al}_2\text{O}_3$, hexagonal crystals with perfect basal cleavage, $n = 1.604$, $n_o = 1.702$, $d_m = 3.69 \pm .01$. These properties are close to those reported for $\beta\text{-Al}_2\text{O}_3$, and the compd. may therefore be a solid soln. of BaO in Al_2O_3 . The results do not agree with those of v. Wartenberg and Reusch (*C. A.* 26, 8239).
 Michael Fleischer

The composition of brownmillerite in portland cement clinker. N. A. Toropov, N. A. Shishakov and L. D. Merkov. *Tsiment* 3, No. 1, 24-34(1937).—Crystal-optical and x-ray investigations of the binary system brownmillerite-pentacalcium trialuminate showed that in the clinker celite can be obtained brownmillerite contg. in the form of a solid soln. a considerable amount (up to 35%) of $3\text{CaO} \cdot 3\text{Al}_2\text{O}_3$. The presence of solid solns. was observed in brownmillerite contg. different amounts of $3\text{CaO} \cdot 3\text{Al}_2\text{O}_3$. It is concluded that brownmillerite has a variable compn. and that considerable alumina over that equiv. to the Fe_2O_3 of brownmillerite can also be absorbed by its crystals in portland cement clinker. | <p>CA</p> <p>Binary system sodium ferrite-sodium aluminate. N. A. Teresov and N. A. Shishakov. <i>Acta Physicochim. U. R. S. S. 11, 377-86(1938)</i> (in English).—Microscopic detns. of the α and Debye x-ray photographs show that the system $\text{Na}_2\text{O} \cdot \text{Al}_2\text{O}_3$–$\text{Na}_2\text{O} \cdot \text{Fe}_2\text{O}_3$ forms a continuous series of solid solns. The sep. components have very similar patterns, and both are thermally stable at 1500°. Data obtained for $\text{Na}_2\text{O} \cdot \text{Al}_2\text{O}_3$ agree with those of Brownmiller and Bogue (<i>C. A. 26, 4233</i>) but those for $\text{Na}_2\text{O} \cdot \text{Fe}_2\text{O}_3$ do not agree with those of Goldstaub (<i>C. A. 27, 2860</i>). F. H. Rathmann</p> | | | |

Replacement of sodium in crystals of " β -alumina" with calcium, strontium and barium. N. A. Toropov and M. M. Stuklova. *Compt. rend. acad. sci.-U.-R.-S. S. S. 27, 974-7(1940)* (in English); cf. C. A. 33, 4533'. " β -Alumina" serves to denote a rather extensive group of aluminates characterized by relatively large Al_2O_3 contents. One g. of Na β -aluminate powder (250-mesh) was fused with a 6-fold quantity of alk. earth chloride for 1 hr. The resulting crystals were not homogeneous, but after a 3rd 1-hr. fusion period the crystals became optically homogeneous. The prepd. $CaO.8Al_2O_3$ possessed a d. of 3.25, n of 1.702, and a birefringence of 0.035 with a neg. optic sign. The BaO - and SrO - β -aluminates were similar in properties to the CaO compd. These crystals are of the holohedral class of the hexagonal system and

have parameters in A. units for the CaO -, SrO - and BaO -aluminates, resp., of $a = 5.530, 5.557$ and 5.577 , and $c = 21.525, 21.945$ and 22.07 . H. E. Mesmore

Phase composition and binding properties of aluminosilicate cement. N. A. Toropov and V. V. Serov. *J. Appl. Chem.* (U. S. S. R.) 17, 170-7 (1944) (English summary).—In chem. compo., aluminosilicate cement lies between white portland cement and aluminous cement. Its cryst. phases are gehlenite ($2\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot \text{SiO}_2$), β - and γ - $2\text{CaO} \cdot \text{SiO}_2$, $6\text{CaO} \cdot 3\text{Al}_2\text{O}_3$, $\text{CaO} \cdot \text{Al}_2\text{O}_3$ and MgO . The greater the gehlenite content the less is the structural strength.

SOLID SOLUTIONS IN THE SYSTEM $\text{CoO-Fe}_2\text{O}_3$. N. A. TOROPOV, E. A. PORAI-KOSHITS, AND A. I. BORISENKO. Doklady Akad. Nauk S.S.S.R. v. 66, 905-8 (1949); cf. C. A. 43, 4552b. In an equimol. mixt. of the pptd. hydroxides, ferritization is complete on 40 hrs. heating at 1100° of pellets dried at 120° and pressed under 3000 kg./sq. cm. The thermal dissocn. $6\text{Fe}_2\text{O}_3 \rightarrow 4\text{Fe}_3\text{O}_4 + \text{O}_2$, in mixts. with CoO, is less intense than in mixts. with NiO. In the presence of excess CoO, the product obtained is porous, and contains, on microscopic exam., 2 phases, one dark-gray, the other dark-yellow. The amt. of the former decreases with decreasing CoO. With increasing Fe_2O_3 content, the color of the crystals seen in specimens etched with HNO_3 changes from dark-yellow in the equimol. comn., to yellow for $2\text{CoO} + 5\text{Fe}_2\text{O}_3$. With further increasing excess of Fe_2O_3 , a new light phase appears along with the yellow crystals, attaining 45-50% in $\text{CoO} + 6\text{Fe}_2\text{O}_3$. By x-ray examn., free Fe_2O_3 is

Zinc borates. N. A. Toropov and P. P. Kononov.
Doklady Akad. Nauk S.S.S.R. 66, 1105-8(1940); cf.
C.A. 33, 3896³.—The system $\text{ZnO-B}_2\text{O}_3$ was investigated
 by means of heating curves, and the solid phases were
 identified by x-ray diffraction studies. Three compds. were
 found: $3\text{ZnO} \cdot \text{B}_2\text{O}_3$, m. 1125° ; $\text{ZnO} \cdot \text{B}_2\text{O}_3$, m. 1080° ;
 $\text{ZnO} \cdot 3\text{B}_2\text{O}_3$, decomp. at 900° into $\text{ZnO} \cdot \text{B}_2\text{O}_3$ and a liquid
 contg. 2% ZnO . The system is characterized by having
 a 2-liquid-phase region extending from 8 to 48% ZnO and
 with a lower limit of 990° . The upper limit was not
 detd. but was above 2000° . There are 3 eutectics:
 990° , 48% ZnO ; 1010° , 68% ZnO ; 1080° , 83% ZnO .
 n_D and n_F are, resp.: $\text{ZnO} \cdot \text{B}_2\text{O}_3$, 1.643, 1.676; $3\text{ZnO} \cdot \text{B}_2\text{O}_3$,
 1.609, 1.720; $\text{ZnO} \cdot 3\text{B}_2\text{O}_3$, 2.004, 2.020. Arild J. Müller

"Solid Solutions in the System ZnO - Fe₂O₃." N. A. Toropov, A. I. Borisenko

"Dok Ak Nauk SSSR" Vol LXXXII, No 4, pp 607-609

The crystal phases in the system ZnO - Fe₂O₃ are examined microscopically and by X-ray diffraction. The compounds studied were ZnO-Fe₂O₃, ZnO-3Fe₂O₃, ZnO-5Fe₂O₃, and others. Comparison of results of X-ray study of the synthesized zinc ferrite with those of New Jersey franklinite shows the 2 substances to be analogous. Compounds containing 66, 24 - 83.07% Fe₂O₃ by wt form homogeneous solid solutions on being heated to 2137°K.

1,100°. Compounds within the limits of a homogeneous ferrite phase exhibit spinel structure, ZnFe₂O₄ (zinc ferrite) is an important ingredient of oxide magnets.

Kinetics of formation of dicalcium silicate. N. A. Tugov, A. M. Givtling, and I. G. Luginina. *Doklady Akad. Nauk S.S.S.R.* 24, 203-5 (1952).—A mixt. (500 g.) of 2 moles CaCO_3 + 1 mole SiO_2 , grain size of both reagents 70-80 μ , pressed under 230 kg/cm², was heated at 1,450°, and free CaO and unbound SiO_2 were detd. every 20 min., up to 320 min. The results were evaluated with the aid of the equation of diffusional kinetics in spherical particles, $f = 1 - \frac{1}{3} \sqrt{\frac{r}{R^2}} = (1 - G)^{-1/2} = K\tau$, where f = fraction reacted, and τ = time in min. From $G \geq 0.38$ up, K has a practically const. value of 5.13×10^{-4} . f increases linearly with τ from 140 to 320 min. The silicate formation rate is detd. by the diffusion of CaO to the SiO_2 across a layer of the product. Jander's equation (C.A. 21, 3798) is inapplicable to these exptl. results, as f 's const. varies with the degree of conversion. S. Thom.

Independent reactions. A. Skrabal (Osterr. Akad. Wissensch., Graz, Austria). *Monatsh.* 83, 531-40 (1952).—The concept of independent reactions, i.e. reactions between which no math. relations exist, is explained and illustrated in terms of the system of 9 possible reactions among the compounds A_2O , R_2O , AOH , ROH , AOR , and H_2O , where A is a univalent acyl and R a univalent alkyl group. Both the math. method, which involves setting up a matrix of reactions, and the "chem." method which makes a more direct use of the chem. equations, indicate that in this system the no. of independent reactions is 3 and the no. of independent relations among the reactions is 6. In a given system there are in general several possible sets of independent reactions. The no. of independent reactions corresponds to the no. of independent analyses necessary to det. the progress of the reactions at a given time and also to the max. no. of stages to which the system may react. E. R. F.

The binding of calcium oxide in burning portland cement raw mixes, as a function of the size of granules. N. A. Toropov and I. G. Lugnina. *Silikattech.* 4, 470-1 (1953); cf. *C.A.* 48, 972h. For a special study of the optimum conditions for accelerated burning of portland cement, the authors detd. the functional relations between the size of granules from the raw mix and the temp. distribution in a kiln, the time of exposure to the firing temps. in the sintering zone, finally the effects of addns. of NaF or CaF_2 . The degree of reaction of free CaO with the ingredients of the raw mix is measured by analytical methods and controlled under the microscope. The firing process is distinctly accelerated by reducing the diam. of the raw mix granules from 6 to 1.25 mm. The mineralizing effects of the fluorides are better for relatively lower firing temps., while at higher temps. their volatilization is marked. The time for a complete clinkerization is for granules of 1.25 mm. diam. at 1600° only 3.5 min., and in the presence of fluorides (for a clinker rich in $2\text{CaO} \cdot \text{SiO}_2$) even only 10-15 sec. Industrial kilns, with granules of more than 6 mm. in diam., require in general a sintering time at 1500° of 6 to 7 min., and if CaF_2 was added, only of 1.5 to 3 min. In the last sintering period, the rate of CaO binding in the clinker minerals is distinctly decreased. It is important to know that granules of less than 6 mm. in diam. in most industrial kilns are unnecessarily retained in the sintering zone.

✓ Effect of the grain size of raw materials on assimilation of CaO during burning of portland cement. N. A. Toropov and I. G. Lukhina. *Cement* 19, No. 2, 17-22 (1953).
- With decreasing grain size, assimilation of CaO increases considerably. Mineralizers (NaF and CaF₂) exert an accelerating influence; however, the effect is less the higher the temp. and the smaller the grain size. By decreasing grain size to 1.25 mm., burning at 1600° is reduced to 3.5 min. for av. clinker and to 10-15 sec. for belite clinker with addn. of mineralizers. However, rise in temp. to 1600° is not always possible. The grain size of the product from the rotary kiln is diverse. Of the total clinker, 52% by wt. were grains < 5.00 mm. In 50% of the mixt., clinker

formation is completed in 5-7 min. after entrance into the burning zone. However, the presence of large grains favors the increase of CaO in the total mass of clinker. When burning av. clinker with CaF₂, assimilation of CaO in small grains is completed in 1.5-3.0 min. in the burning zone; for large grains, the burning time is increased 4-5 times.

Investigation of the system tricalcium silicate-tricalcium phosphate. N. A. TOROPOV, A. I. HORISHENKO, AND P. V. SUTTOROVA. ~~Phys. Akad. Nauk S.S.S.R.~~ 92 (5) 1015-18 (1963).

Disks made from mixtures of $3\text{CaO} \cdot \text{SiO}_2$ (I) and $3\text{CaO} \cdot \text{P}_2\text{O}_5$ (II) were heated at 1450°C , and every 10 min. a different disk was removed and subjected to microscopic and chemical analysis. Disks prepared of 98 to 50 mole % I and 2 to 50 mole % II were found to consist of tricalcium silicate, free CaO , solid solutions of silicophosphates, and tetracalcium phosphate (III), in amounts depending on the original proportions of I and II. Free CaO increased with time, reaching a maximum in 60 min. At this point, tricalcium silicate, dicalcium silicate, CaO , tricalcium phosphate, and traces of tetracalcium phosphate were observed. After 70 min. at 1450°C , free CaO dropped to a minimum. Free CaO is formed in accordance with $3\text{CaO} \cdot \text{SiO}_2 \rightarrow \text{CaO} + 2\text{CaO} \cdot \text{SiO}_2$ and only in the presence of II. Detection of III is indicative of the reaction $3\text{CaO} \cdot \text{P}_2\text{O}_5 +$

$\text{CaO} \rightarrow 4\text{CaO} \cdot \text{P}_2\text{O}_5$. After 90 min., silicoearnothite was also detected and there was a further increase in the amount of free CaO , reaching a constant limit at 100 to 140 min. The final content of free CaO depended on the composition of the disks, increasing to 11.47 wt. % for 0 to 20 mole % II and dropping to 0 for 60 mole % and more II. In all cases, free CaO was less than that expected from decomposed I. This was traced to solution of CaO in silicoearnothite and nagelschinklite with the formation of more basic silicophosphates. Investigation of cements with ionization x-ray analysis.
N. A. Toropov, P. F. Korovaylov, A. I. Efremov, and G. V. Anan'eva. *Tsiment* 20, No. 3, 17-20 (1954).—Processes of disson. of limestone, transformations of kaolinite, and formation of dicalcium silicate were investigated with an ionization x-ray installation comprising source of x-rays (x-ray tube), goniometer, high-temp. furnace, receiver of x-ray radiation (gas amplifier), electrometric amplifier of d.c., and recorder of ionization curves. Disson. of carbonate occurs somewhat above 500° and is complete at 700°. At 900°, dicalcium silicate changes from the γ -modification into a new α' -modification. At 600°, kaolinite undergoes structural changes and becomes amorphous; it remains amorphous to 900-1000°, after which mullite starts to form slowly and then speeds up at 1200°. At 1200°, α -cristobalite forms from excess amorphous silica. B. Z. Kamich

Торопов Н.А.

Interaction of calcium phosphate with clinker materials.
N. A. TOROPOV AND A. I. BORISENKO *Tsement*, 20 [8] 10-14 (1964). The study dealt with the high-temperature reactions of tricalcium phosphate with the synthetic clinker materials $2\text{CaO} \cdot \text{SiO}_2$, $3\text{CaO} \cdot \text{SiO}_2$, $4\text{CaO} \cdot \text{Al}_2\text{O}_3$, Fe_2O_3 , $3\text{CaO} \cdot \text{SiO}_2 + 2\text{CaO} \cdot \text{SiO}_2$, and $2\text{CaO} \cdot \text{SiO}_2 + 3\text{CaO} \cdot \text{SiO}_2$. Incomplete linking of CaO during burning of raw cement mixtures containing P_2O_5 is due to thermal decomposition of tricalcium silicate in the presence of P_2O_5 with the formation of dicalcium silicate and free CaO . The influence of tricalcium phosphate on a mixture of dicalcium and tricalcium silicates during burning is determined by the proportion of these silicates in the mixture. The permissible content of P_2O_5 increases with decreasing content of tricalcium silicate in the clinker. The content of P_2O_5 should be established on the basis of physical tests. The behavior of mixtures of tricalcium silicate with tetracalcium aluminoferrite in the presence of additions of tricalcium phosphate is analogous to the behavior of tricalcium silicate. Tricalcium phosphate does not react with Ca aluminoferrites although it dissolves therein during melting. The P_2O_5 is in the clinker as a component of belite, which dissolves Ca silicophosphates, and in the ferruginous phase, which dissolves up to 28% $3\text{CaO} \cdot \text{P}_2\text{O}_5$ at 1600°C . Change in the appearance of crystals of P_2O_5 in mixtures is determined by nonuniformity of crystals, indicating the start of decomposition of $3\text{CaO} \cdot \text{SiO}_2$. Use of carbonates containing P_2O_5 should be limited to the production of belite cements. B.Z.K.

Alleged Investigation of Cr_2O_3 -colored crystals of synthetic ruby. *2*
 N. A. Toropov and I. P. Andreev. *Trudy Leningrad. Tekhnol. Inst. im. Lensoveka* 1954, No. 29, 80-5. The absorption spectrum of the ruby crystals is used for a photometric detn. of the amt. of the staining oxide. The transmittance (T) curves which are related to the extinction curves are defined by the relation $D = \log T$ (D is the optical d.), following the Lambert-Beer law. The measurements were made with crystal plates oriented parallel and perpendicular to the optical axis. The characteristic absorption peaks are at 410, and 550 to 560 mμ parallel to the optical axis, and 420 and 560 to 570 perpendicular to the optical axis. The optical d. and the extinction coeff. of samples perpendicular to the optical axis are considerably higher than those for the orientation parallel to the optical axis. They are linear functions of the concn. in Cr_2O_3 . Also a_0 and c_2 of the unit cell increase proportionally to the Cr_2O_3 content. X-ray powder data are given for leucosapphire and a ruby with 3.2% Cr_2O_3 . W. Encl.

Title : Effect of fluoride compounds on solid calcium aluminoferrite solutions

Periodical : Dok. AN SSSR 98/3, 415-418, Sep 21, 1954

Abstract : The effect of certain fluoride compounds on the stability of solid solutions of $2\text{CaO} \cdot \text{Fe}_2\text{O}_3$, $4\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot \text{Fe}_2\text{O}_3$ and $6\text{CaO} \cdot 2\text{Al}_2\text{O}_3 \cdot \text{Fe}_2\text{O}_3$, was investigated at high temperatures. It was established that the crystals of the investigated solid calcium aluminoferrite solutions form a so-called "celite" of Portland cement clinker and also make it possible to determine certain technical properties of the cement. Six references: 2-USA; 2-German; 1-Italian and USSR (1928-1951). Tables; illustrations.

✓ Structure of Glass - Report of a Symposium on the Structure of

Glass, Leningrad, November 23 to 27, 1933. Edited by A. A.

LEBEDEV, N. A. TOROSOV, V. P. BAZZAROVSKI, AND A. A.

APPEN. Akademiya Nauk S.S.S.R., Leningrad-Moscow, 1955.

308 pp.—Upon the invitation of the Institute of Silicate Chem-

istry of the Academy of Sciences U.S.S.R., the State Optical

Institute, and the Leningrad Section, All-Union Society of Silicate

Technological Research, a symposium on the structure of glass

was organized, which was attended by more than 500 representa-

tives from 90 institutions and 28 cities of the U.S.S.R. The

introductory address by A. A. Lebedev emphasizes the im-

portance of structural conversions in glass as the basis of many

phenomena which cannot be explained otherwise, e.g., the an-

nealing range of optical glass, the luminescence, and the dif-

fraction of X rays, electrons, and neutrons. The crystallites,

as assumed in some theories, in the order of magnitude of 10 to

15 a.u. should be detectable through more accomplished electron

microscopic methods in the future. The chain structures assumed

by others are still hypothetical; their confirmation would be an

important approach toward the manufacture of unbreakable

glass. The titles of the papers read in the symposium are as

follows: K. S. Evstrop'ev: "Crystallite theory of glass structure"

(pp. 9-18). P. P. Kobeko: "Structure and properties of

organic glasses" (pp. 19-25). O. K. Botvinkin: "Glass struc-

ture" (pp. 26-29). E. A. Peral-Koshits: "Possibilities and

results of X-ray methods in the investigation of glassy ma-

terials" (pp. 30-43). O. A. Esin and P. V. Gel'd: "Structural

A. A. LEBEDEV

conductance of glasses in strong electric fields; II, The wetting of metals by glass" (pp. 267-69). V. P. Pryanishnikov; "Electric conductance of silica glass" (pp. 270-72). E. P. Azarov; "Structure of enamels and their properties" (pp. 273-76). A. G. Repa; "Oxygen potential of glass" (pp. 276-79). L. V. Sergeev; "The glassy state of organic polymers" (pp. 280-82). Yu. N. Andreev; "Problems of the methodological basis of the actual ideas on the structure of glass" (pp. 283-89). The ample discussions (pp. 293 to 302) include the following main items: general remarks on the nature of glass; physical chemistry of polycomponent systems and the glass structure; optical properties and glass structure; caloric and electrical properties and the structure of glass; crystallochemistry and glass structure; and problems of further development of glass science. The concluding address of A. A. Lebedev (pp. 300-02), and the official resolution of the Symposium Meeting (pp. 303-05) announce plans for another Symposium on the Structure of Liquids and, in 1966, the third Symposium on the Structure of Glass, under the auspices of the Academy of Sciences U.S.S.R. The present volume is excellently printed and illustrated; it is a real milestone in the evolution of modern investigations on glass structure.

Title : Solid solutions formed by celsian, dibarium trisilicate and barium disilicate (Sanbornite)

Periodical : Izv. AN SSSR. Otd. khim. nauk 1, 3-8, Jan-Feb 1955

Abstract : Experiments were conducted to establish the zone, boundaries and liquidus of a ternary solid solution formed by barium disilicate, dibarium trisilicate and celsian. It was found that the refraction index for this zone depends largely upon the barium disilicate and aluminum oxide contents of the solution. The refraction index decreases with the increase of barium disilicate and Al_2O_3 . The equilibrium ratio of the investigated solution was established on the basis of several polythermal samples with constant Al_2O_3 contents. Two USA references (1922 and 1950). Influence of fluorine salts on tricalcium aluminate at high temperatures. N. A. TOROPOV, B. V. VOLKONSKIY, AND V. I. MITYAYEV. Tsimenty, 21-24: 12-13 (1955).—Roentgen-ionization analysis was used to determine the effect of 5% K, Na, and Ca fluoride on tricalcium aluminate at temperatures up to 1600°C. Sodium and K fluorides begin to exert their influence and cause decomposition of tricalcium aluminate at 800° into pentacalcium aluminate and free CaO. Above 1300°, the influence of these salts ceases. The action of CaF_2 is similar to that of NaF and KF, but tricalcium aluminate decomposes at $t \approx 1000^\circ$.

TITLE: Synthesis of a Fluoberyllate Type of the Double Calcium
and Barium Metasilicate (Sintez ftoroberillatnoy modeli
dvoynogo metasilikata kal'tsiya i bariya)

PERIODICAL: Sb. nauch. rabot po khimi i tekhnol. silikatov, Moscow,
Promstroyizdat, 1956, pp 20-23.

ABSTRACT: The compound $2\text{NaF} \cdot \text{KF} \cdot 3\text{BeF}_2$, the fluoberyllate analogue
of the double calcium and barium metasilicate $2\text{CaO} \cdot \text{BaO} \cdot$
 3SiO_2 , has been synthesized. The following were used
in the synthesis: 1) sodium fluoride (98 percent NaF),
2) potassium fluoride in the form of $\text{KF} \cdot \text{H}_2\text{O}$ (77 percent
KF), and 3) beryllium fluoride, obtained by treating
beryllium oxide with hydrofluoric acid (97.5 percent
 BeF_3). The fusion was made in a covered platinum cruci-
ble in a crucible furnace and then quenched (the
melt poured out into a pan). To compare the compound
